

A: FIND A NEW APP

Finding Apps

Apps (short for Applications) are small software that run on your mobile device. There is an app for almost anything! Some are free, and some are paid apps.

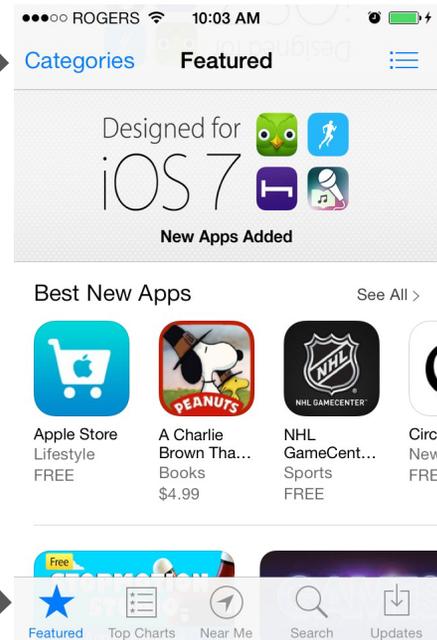

Open the App Store

On your device, find and tap on the App Store icon.

Search and Browse

Within the App Store, search for the app you are looking for or browse popular and recent App Store additions. Tap Categories in the top left to browse app categories, or choose an option in the bottom menu.

B: INSTALL YOUR APP

Download Apps

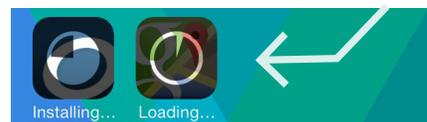

Note: it's best to download apps using wi-fi on your device, rather than using up data. Some apps are large in size.

Read About the App

You can tap on an app icon in the store to bring up more information about the app. If the app costs money, it is worthwhile taking some time to check ratings and read reviews before purchasing. There are no refunds.

Download

If you decide to install the app, tap the FREE (or \$ Amount) button, and then tap INSTALL. (If you have previously downloaded this app and are reinstalling it, there will be a small cloud and arrow button instead.) You may be prompted to enter your App Store password. Your new app will start loading onto your home screen in an available empty space. Wait for it to finish installing before tapping to open it.

C: CLOSE YOUR APPS

Background Apps

You can multitask in iOS by running multiple apps at once and bouncing between them. Apps do not close when you go to your home screen, they must be manually closed. Running too many apps at once can use up your battery and cause performance issues.

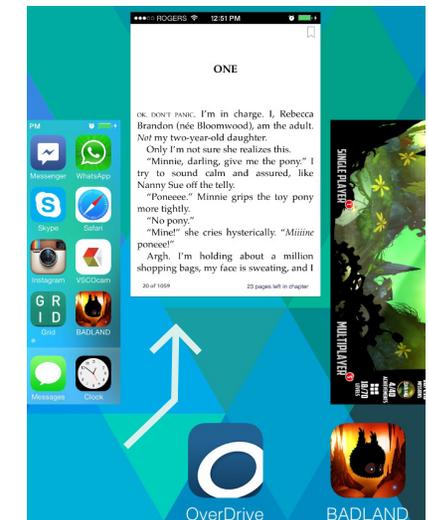

In iOS 6

Press the round Home button twice to bring up the list of your running apps at the bottom of the screen. Tap and hold one of the app icons until they start to wobble. Tap the red dots on the apps you wish to close.

In iOS 7

Press the round Home button twice to bring up your running apps. Swipe upwards on the preview of each app you wish to close.

D: DELETE AN APP

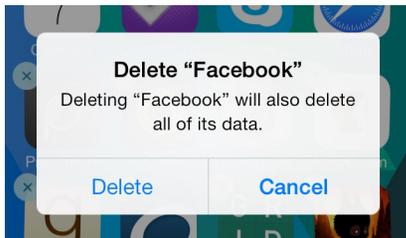

Want To Get Rid of an App?

Uninstalling apps from iOS is very simple. If you are planning to access the settings and other information associated with your app, you will first need to back up your device before deleting the app. Deleting apps will delete all files, settings, and information used and created in that app.

01

Delete

Tap and hold any app icon on your home screen until your apps wobble and small dots appear with X's in them. Tap the X on the app you wish to delete. A pop-up will appear, asking you to confirm.

02

Exit

You can exit out of this Delete mode by pressing the round Home button.

E: SHUT DOWN

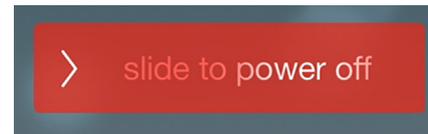

Turning It Off

There are many reasons to turn your device off. You may wish to conserve battery life, take a technology break, remove distractions from important life events (such as weddings), or restart the device to address performance issues.

01

Press and Hold

Find the Sleep/Wake button on the very top right of your device. Press and hold this button until a red slider appears. Drag the slider over to the right to power off.

02

And On Again

To turn the device back on, press and hold the Sleep/Wake button again. An apple will appear for a few moments while the device starts up. Also, if the device is off and you plug it in with the charger, it will automatically power back on.
